

CORONARY ANGIOGRAPHY REPORT

Patient Name: BAKARY KONATE

Date of Procedure: 01.09.2020

Interventional Cardiologist: Dr. E.A.

PROCEDURE PERFORMED:

1. Selective right and left coronary angiography.

INDICATION FOR PROCEDURE:

CHEST PAIN

COMPLICATIONS:

None.

DESCRIPTION OF PROCEDURE:

Informed consent was obtained prior to presentation to the cardiac catheterization lab. The patient was brought to the cardiac catheterization lab in a fasting state and prepped and draped in sterile fashion. The left radial was then anesthetized via 2 ml of 2% lidocaine, and the left radial artery was accessed via single wall puncture technique. A 6-French radial arterial sheath was advanced over a guidewire using modified Seldinger technique.

Next, a 6-French JR4 catheter was advanced over the guidewire to the level of the ascending aorta. This catheter was used to selectively engage the right coronary artery, which was then imaged in multiple planes and views. The JR4 catheter was then withdrawn over the guidewire.

Next, a 6-French JL4 catheter was advanced over the guidewire to the level of the ascending aorta. This catheter was used to selectively engage the left main coronary artery. The left main

coronary artery and its branches were then imaged in multiple planes and views. The JR4 catheter was subsequently withdrawn over the guidewire.

At the termination of diagnostic coronary angiography, the patient was referred for medical treatment and diet therapy.

SELECTIVE CORONARY ANGIOGRAPHY:

1. Left main: The left main is long and bifurcates into left anterior descending and circumflex coronary arteries. The left main artery is normal.
2. Left anterior descending: The left anterior descending artery has plaques.
3. Circumflex: The circumflex coronary artery has plaques.
4. Right coronary artery: The right coronary artery has plaques.

FINAL DIAGNOSIS:

Coronary artery disease.

PLAN:

We recommended for him at first place medical treatment.
