Note

Richard returns today after being seen last approximately 2 years ago for gynecomastia and skin laxity of his abdominal wall. At that time I recommended that the breast be addressed with liposuction and direct excision if necessary. Today I believe that holds true and emphasize that the goal is not to recreate the chest wall of a 16-year-old male but to reduce the size of his breast knowing that there will be some skin laxity. He has agreed and understands the strategy.

Examination of the abdominal wall as compared to photos from 2 years ago is unchanged. I did sketch for him the procedure and how we will remove the excess skin and why drains are placed and kept there for 2 weeks. Compression garments will be worn for the chest and the abdomen; explanation given for both and he understands. I also made it clear that no showering will be permitted until the drains are removed. Discussed with him the opioid consent form and he signed it. He will be given a prescription for Norco 5/325 mg tabs as well as Keflex 500 mg tabs.

Compression garment: MV Large and XL
Chest 43"
Waist 44"
